Planning Document

Introduction

The Toohak backend project is an attempt at replicating the popular game "Kahoot". So far up until iteration 3 we have successfully implemented numerous features, for example, registering users, logging in users, making quizzes and questions with answers, all the way to the minute details of adding pictures and thumbnails and many more. However, we recognise that these are not enough to develop a feasible software. Hence, this report will focus on several potential improvements and future enhancements for the program.

Future Prospects

For future development, we can have functions like;

- Session to be selectable between Private and Public
- Allow only specific users to join the session
- Set a password on the session to join
- Statistics for the quiz/question calculated across all existed sessions

These functions improve security of the session, and encourage more private sessions. Statistics makes it more fun to review results, comparing one's own result to other players all over the world.
These functions can be implemented with not too complex methods.
